FOR SALE

46 Acres Pasture Land with Hunting Cabin Marlin, Falls County, TX 76661

\$126,500

For a virtual tour and investment offering go to: www.texasfarmandranchrealty.com/sales.htm

PROPERTY HIGHLIGHTS

Location - The property is located at 250 CR 236 just off Hwy. 6 North in Marlin. The acreage consists of approximately 46 acres of pasture and hunting land with a tank and a creek. From the intersection of Hwy. 7 and Hwy. 6 in Marlin, start by going East on Hwy. 7 out of Marlin for 1 mile. Turn right onto FM 2958 and go .4 miles. Follow curve right onto CR 236 and go .5 miles and the property will be on the left.

Acres: - 46 acres MOL out of a larger tract of 87 acres according to the Falls County Appraisal District.

Utilities - The property is serviced by TXU Energy, has a water well with a curb septic tank.

Topography - The property is level, flat and heavily wooded.

<u>Current Use</u> - The property is privately owned and is used for hunting, fishing and pastureland for cattle. There are existing camping quarters of approximately 575 square feet. The quaint quarters consist of a kitchen /den combo, 2 bedrooms and a bath.

Ground Cover - 46 acres of flat and heavily wooded pastureland with some improved for pasture.

Minerals - Owner will convey 100% of the minerals that are available (if any).

Easements - There is a gas pipeline easement on the property.

Showings - By appointment and combo lock. If applicable, buyers who are represented by agent/broker must have their agent/broker present at the initial showing.

Price - \$126,500.00

Soil Type Legend

Falls County, Texas (TX145)			
Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
19	Crockett fine sandy loam, 0 to 1 percent slopes	21.6	47.5%
21	Crockett fine sandy loam, 2 to 5 percent slopes, eroded	5.8	12.7%
28	Gowen clay loam, frequently flooded	0.3	0.6%
65	Wilson silty clay loam, 0 to 1 percent slopes	17.8	39.2%
Totals for Area of Interest		45.5	100.0%

Soil Type - 19

19-Crockett fine sandy loam, 0 to 1 percent slopes. This deep, moderately well drained, nearly level soil is on broad uplands and narrow ridgetops. Slopes are convex, and areas range from 50 to 200 acres in size.

This soil has a surface layer of brown, medium acid fine sandy loam about 10 inches thick. Between depths of 10 and 15 inches is reddish brown, medium acid clay that has reddish yellow and yellowish brown mottles. Between depths of 15 and 26 inches is brownish yellow, medium acid clay that has yellow and yellowish red mottles. Below this layer, to a depth of 37 inches, is light reddish brown, slightly acid clay that has yellowish red and yellow mottles. Very pale brown, neutral clay that has yellow, brownish yellow, and reddish yellow mottles is between depths of 37 and 56 inches. The underlying layer, to a depth of 80 inches, is light gray, moderately alkaline clay

This soil is difficult to work; when dry, it forms extremely hard surface crusts. A dense plowpan forms in cultivated areas. Permeability is very slow, and available water capacity is high. The root zone is deep, but root penetration is slow and difficult in the underlying layers. Runoff is slow. The hazard of water erosion is slight.

Included with this soil in mapping are a few intermingled areas of Normangee and Wilson soils. The included soils make up 10 to 20 percent of this map unit.

This soil has medium potential for crops. The major crops are small grain for winter grazing and grain sorghum. The major objectives in management of this soil are improving soil tilth, maintaining fertility, and controlling erosion. Proper management includes growing high-residue crops and deep-rooted legumes.

This soil has high potential for pasture. It is well suited to coastal bermudagrass, common bermudagrass, and weeping lovegrass. Good pasture management includes fertilization, weed control, and controlled grazing.

This soil has high potential for range. The climax plant community is a mixture of tall and mid grasses and an overstory of a few live oak, elm, and hackberry trees along streams and occasionally in motts.

This soil has low potential for most urban uses. Its most restrictive limitations are shrinking and swelling with changes in moisture, corrosivity to uncoated steel, low strength, and slow percolation. The potential for recreation is medium. The very slow permeability is the most restrictive limitation for this use. Potential for openland and rangeland wildlife habitat is medium. Capability subclass IIIs; Claypan Prairie range site.

Soil Type - 21

21-Crockett fine sandy loam, 2 to 5 percent slopes, eroded. This deep, moderately well drained, gently sloping soil is on uplands. Soil areas are long, narrow bands that slope to natural drainageways. They range from 10 to 150 acres in size. Slopes are convex. Water erosion has removed part of the original surface layer. Many areas are dissected by gullies about 1 to 2 feet deep and 75 to 100 feet apart.

This soil has a surface layer of yellowish brown, medium acid fine sandy loam about 4 inches thick. Between depths of 4 and 12 inches is reddish brown, slightly acid clay that has reddish yellow and yellowish red mottles; and between depths of 12 and 29 inches is medium acid clay that is brown in the upper part and yellowish brown in the lower part. Mottles are brown and yellowish red. Between depths of 29 and 46 inches is brownish yellow, neutral sandy clay that has pinkish gray and light brownish gray mottles. The underlying layer, to a depth of 80 inches, is mottled brownish yellow and very pale brown, mildly alkaline sandy clay loam.

This soil is difficult to work. When dry, the surface becomes extremely hard. Permeability is very slow, and available water capacity is high. The root zone is deep, but root penetration is slow and difficult in the underlying layers. Runoff is medium. The hazard of water erosion is moderately severe.

Included with this soil in mapping are a few intermingled areas of Normangee and Wilson soils. The included soils make up about 10 to 20 percent of this map unit.

This soil has low potential for production of crops. The major crops are grain sorghum, cotton, and hay. The objectives in management are improving tilth, maintaining fertility, and controlling erosion. Terracing, growing crops that produce large amounts of residue, and growing deeprooted legumes help to control erosion and maintain tilth.

This soil has medium potential for pasture. It is well suited to coastal bermudagrass, common bermudagrass, and weeping lovegrass. Proper pasture management includes fertilization, weed control, and controlled grazing.

This soil has high potential for range. The climax plant community is a mixture of tall and mid grasses and an overstory of a few live oak, elm, and hackberry trees along the streams and occasionally in motts.

This soil has low potential for most urban uses. Its most restrictive limitations are shrinking and swelling with changes in moisture, corrosivity to uncoated steel, and slow percolation. The potential for recreation is medium. The very slow permeability and slope are the most restrictive limitations for this use. Potential for both openland and rangeland wildlife habitats is medium. Capability subclass IVe; Claypan Prairie range site.

Soil Type - 28

28-Gowen clay loam, frequently flooded. This deep, well drained, nearly level soil is on flood plains along major streams. It is flooded two or three times each year; flooding lasts from several hours to several days. Areas have plane slopes of 0 to 1 percent. These areas are on flood plains in long, narrow bands and are dissected by old creek beds and by meandering channels. Individual areas range from 20 to about 200 acres in size.

The soil has a surface layer of very dark grayish brown, neutral clay loam about 23 inches thick. Below the surface layer, to a depth of 36 inches, is brown, neutral clay loam. The underlying layer, to a depth of 80 inches, is dark grayish brown, neutral clay loam stratified with fine sandy loam and clay in the lower part.

Permeability is moderate, and the available water capacity is high. The root zone is deep and easily penetrated by roots. Runoff is slow. The hazard of water erosion is slight.

Included with this soil in mapping are a few intermingled areas of Bunyan and Trinity soils and areas of Gowen soils that are not flooded each year. The included soils make up about 15 percent of this map unit.

This soil has low potential for production of crops, recreation, and urban uses. The most restrictive limitation is flooding, which can only be overcome by major flood

This soil is well suited to pasture and has high potential for this use. It is well suited to improved bermudagrass, johnsongrass, common bermudagrass, and kleingrass. Proper management includes fertilization, controlled grazing, and weed control.

This soil has high potential for range. The climax plant community is a mixture of tall and mid grasses and an overstory of scattered oak, pecan, hackberry, elm, and cottonwood trees.

This soil has low potential for openland wildlife habitat and medium potential for rangeland wildlife habitat. Capability subclass Vw; Loamy Bottomland range site.

Soil Type - 65

65-Wilson silty clay loam, 0 to 1 percent slopes. This deep, somewhat poorly drained, nearly level soil is on uplands and ancient stream terraces. Slopes are plane. Areas range from 20 to 200 acres in size.

This soil has a surface layer of dark gray, mildly alkaline silty clay loam about 6 inches thick. Below the surface layer, to a depth of 25 inches, is dark gray, mildly alkaline clay. Between depths of 25 and 39 inches is gray, mildly alkaline clay. Below this layer, to a depth of 58 inches, is light gray, moderately alkaline clay that has light yellowish brown mottles. The underlying layer, to a depth of 80 inches, is light olive gray, moderately alkaline clay that has yellowish brown mottles (fig. 10).

This soil is difficult to work because of surface crusts and dense plowpan layers that form in cultivated areas. When dry, this soil is extremely hard; when wet, it is sticky and plastic. Permeability is very slow, and available water capacity is high. The root zone is deep, but root penetration is slow and difficult in the underlying layers. Runoff is slow. The hazard of water erosion is slight.

Included with this soil in mapping are a few intermingled areas of Burleson, Crockett, and Normangee soils. The included soils make up about 10 to 20 percent of this map unit.

This soil has medium potential for production of crops. The major crops are grain sorghum, cotton, hay, and some small grain for winter grazing. The objectives of management are improving tilth and maintaining fertility. Growing crops that produce large amounts of residue and legumes helps maintain tilth.

This soil has medium potential for pasture. It is well suited to coastal bermudagrass, King Ranch bluestem, and weeping lovegrass. Pasture management needed includes fertilization, weed control, and controlled grazing.

This soil has medium potential for range. The climax plant community is a mixture of tall and mid grasses and an overstory of a few live oak, elm, and hackberry trees along streams and in occasional motts.

This soil has low potential for most urban uses. Its most restrictive limitation is shrinking and swelling with changes in moisture, occasional wetness, low strength, corrosivity to uncoated steel, and slow percolation. The potential for recreation is medium. Wetness and the very slow permeability are the most restrictive limitations for this use. Potential for both openland and rangeland wildlife habitat is medium. Capability subclass IIIw: Claypan Prairie range site.

EDUAL HOUSING

Approved by the Texas Real Estate Commission for Voluntary Use

Texas law requires all real estate licensees to give the following information about brokerage services to prospective buyers, tenants, sellers and landlords.

Information About Brokerage Services

efore working with a real estate broker, you should know that the duties of a broker depend on whom the broker represents. If you are a prospective seller or landlord (owner) or a prospective buyer or tenant (buyer), you should know that the broker who lists the property for sale or lease is the owner's agent. A broker who acts as a subagent represents the owner in cooperation with the listing broker. A broker who acts as a buyer's agent represents the buyer. A broker may act as an intermediary between the parties if the parties consent in writing. A broker can assist you in locating a property, preparing a contract or lease, or obtaining financing without representing you. A broker is obligated by law to treat you honestly.

IF THE BROKER REPRESENTS THE OWNER:

The broker becomes the owner's agent by entering into an agreement with the owner, usually through a written - listing agreement, or by agreeing to act as a subagent by accepting an offer of subagency from the listing broker. A subagent may work in a different real estate office. A listing broker or subagent can assist the buyer but does not represent the buyer and must place the interests of the owner first. The buyer should not tell the owner's agent anything the buyer would not want the owner to know because an owner's agent must disclose to the owner any material information known to the agent.

IF THE BROKER REPRESENTS THE BUYER:

The broker becomes the buyer's agent by entering into an agreement to represent the buyer, usually through a written buyer representation agreement. A buyer's agent can assist the owner but does not represent the owner and must place the interests of the buyer first. The owner should not tell a buyer's agent anything the owner would not want the buyer to know because a buyer's agent must disclose to the buyer any material information known to the agent.

IF THE BROKER ACTS AS AN INTERMEDIARY:

A broker may act as an intermediary between the parties if the broker complies with The Texas Real Estate License Act. The broker must obtain the written consent of each party to the transaction to act as an

intermediary. The written consent must state who will pay the broker and, in conspicuous bold or underlined print, set forth the broker's obligations as an intermediary. The broker is required to treat each party honestly and fairly and to comply with The Texas Real Estate License Act. A broker who acts as an intermediary in a transaction:

- (1) shall treat all parties honestly;
- (2) may not disclose that the owner will accept a price less than the asking price unless authorized in writing to do so by the owner;
- (3) may not disclose that the buyer will pay a price greater than the price submitted in a written offer unless authorized in writing to do so by the buyer; and
- (4) may not disclose any confidential information or any information that a party specifically instructs the broker in writing not to disclose unless authorized in writing to disclose the information or required to do so by The Texas Real Estate License Act or a court order or if the information materially relates to the condition of the property.

With the parties' consent, a broker acting as an intermediary between the parties may appoint a person who is licensed under The Texas Real Estate License Act and associated with the broker to communicate with and carry out instructions of one party and another person who is licensed under that Act and associated with the broker to communicate with and carry out instructions of the other party.

If you choose to have a broker represent you, you should enter into a written agreement with the broker that clearly establishes the broker's obligations and your obligations. The agreement should state how and by whom the broker will be paid. You have the right to choose the type of representation, if any, you wish to receive. Your payment of a fee to a broker does not necessarily establish that the broker represents you. If you have any questions regarding the duties and responsibilities of the broker, you should resolve those questions before proceeding.

Real estate licensee asks that you acknowledge receipt of this information about brokerage services for the licensee's records.
