239.52 Acres MOL – Pasture and Recreational Land Marlin, Falls County, TX 76661

Soil Type – 17

17—Burleson clay, 1 to 3 percent slopes. This deep, moderately well drained, gently sloping soil is on stream terraces and uplands. Areas are on broad, convex ridges. They range from 10 to 100 acres in size.

This soil has a surface layer of dark gray, mildly alkaline clay about 42 inches thick. Below the surface layer, to a depth of 47 inches, is gray, mildly alkaline clay that has brownish yellow mottles. The underlying layer, to a depth of 80 inches, is light brownish gray, moderately alkaline clay that has brownish yellow mottles.

This soil is sticky and plastic when wet and is difficult to work. It is extremely hard when dry. Dense plowpans are common in cultivated areas. Permeability is very slow, and available water capacity is high. The root zone is deep, but root movement is very slow in the clayey lower layers. Runoff is medium. The hazard of water erosion is moderate.

Included with this soil in mapping are a few intermingled areas of Houston Black, Branyon, and Wilson soils. The included soils make up 10 to 20 percent of this map unit.

This soil is used mainly for crops. It has a high potential for this use. Grain sorghum, cotton, and small grain are the main crops. Controlling erosion and improving tilth are the major objectives in management of this soil. Terracing and growing crops that produce large amounts of residue help control erosion and maintain soil tilth.

This soil has high potential for pasture. It is well suited to improved bermudagrass, kleingrass, and King Ranch bluestem. Proper pasture management includes fertilization, weed control, and controlled grazing.

This soil has high potential for range, but very few acres are used for this purpose. The climax plant community is tall grasses and an overstory of a few large live oak, elm, and hackberry trees along the drainageways.

This soil has low potential for most urban uses. The limitations that affect urban development are the shrinking and swelling with changes in moisture, corrosivity to uncoated steel, low strength, and slow percolation. The potential for recreation is low. The clayey surface layer and very slow permeability are the most restrictive limitations for this use.

Potential for openland wildlife habitat is medium, and potential for rangeland wildlife habitat is low. Capability subclass IIe; Blackland range site.

**FOR
SALE**

239.52 Acres MOL – Pasture and Recreational Land Marlin, Falls County, TX 76661

Soil Type – 31

31—Heiden clay, 2 to 5 percent slopes, eroded. This deep, well drained, gently sloping soil is on uplands. Most areas are rilled and have shallow gullies that are 100 to 200 feet apart. Slopes are convex. Areas are long and narrow and range from 10 to about 80 acres in size.

This soil has a surface layer of dark grayish brown, moderately alkaline clay about 17 inches thick. Between depths of 17 and 43 inches is grayish brown, moderately alkaline clay. The underlying layer is light yellowish brown, moderately alkaline clay.

This soil is difficult to work. When wet, it is sticky and plastic; when dry, it is hard and clods when plowed. Dense plowpan layers are common in cultivated areas. Permeability is very slow, and available water capacity is high. The root zone is deep, but penetration by roots is slow. Runoff is rapid. The hazard of water erosion is moderately severe.

Included with this soil in mapping are small areas of Ferris soils. This soil occupies shallow gullies and adjoining slopes. This soil makes up about 18 percent of this map unit.

Some areas of this soil are still cultivated, but most areas are now in pasture. This soil has medium potential for production of crops, but it is limited for this use because the surface layer has been eroded away. Grain sorghum, cotton, and small grain are the main crops. The main objectives of management are controlling erosion and improving tilth. Terracing and growing crops that produce large amounts of residue or deep-rooted legumes help control erosion and maintain tilth.

This soil has high potential for pasture. It is well suited to improved bermudagrass, kleingrass, and King Ranch bluestem. Pasture management includes fertilization, weed control, and controlled grazing.

This soil has high potential for range, but very few acres are used for this purpose. The climax plant community is tall grasses and an overstory of a few large live oak, elm, and hackberry trees along the drainageways.

This soil has low potential for most urban uses. Its most restrictive limitations are shrinking and swelling with changes in moisture, corrosivity to uncoated steel, and slow percolation. The potential for recreation is low. The clayey surface layer and the very slow permeability are the most restrictive limitations for this use. Potential for openland wildlife habitat is medium, and potential for

rangeland wildlife habitat is low. Capability subclass IIIe; Blackland range site.

239.52 Acres MOL – Pasture and Recreational Land Marlin, Falls County, TX 76661

Soil Type – 35

35—Houston Black clay, 1 to 3 percent slopes. This deep, moderately well drained, gently sloping soil is on smooth ridges on foot slopes of uplands. Slopes are convex. Areas are long and narrow to broad in shape and range from 10 to 50 acres in size.

The soil has a surface layer of very dark gray, moderately alkaline clay to a depth of 28 inches. The next layer is dark gray, moderately alkaline clay to a depth of 48 inches. Between depths of 48 and 67 inches is olive gray, moderately alkaline clay. The underlying layer, to a depth of 80 inches, is olive yellow and light brownish gray, moderately alkaline clay that has brownish yellow mottles.

This soil is difficult to work. When wet, it is sticky; when dry, it is hard and clods when plowed. Dense plowpan layers are common in cultivated areas. Permeability is very slow, and available water capacity is high. The root zone is deep, but penetration by roots is slow. Runoff is medium. The hazard of water erosion is moderate.

Included with this soil in mapping are small areas of Branyon, Burleson, and Heiden soils. The Branyon soils are on stream terraces. The Burleson and Heiden soils have no particular pattern of occurrence. The included soils make up 10 to 20 percent of this map unit.

This soil is used mainly for crops. The potential for growing crops is high. Cotton and grain sorghum are the main crops, but corn and small grain are also grown. The main objectives of management are controlling erosion and improving tilth. Growing crops that produce large amounts of residue or growing deep-rooted legumes help control erosion and maintain the tilth.

This soil has high potential for pasture. It is well suited to improved bermudagrass, kleingrass, and King Ranch bluestem. Proper pasture management includes fertilization, weed control, and controlled grazing.

This soil has high potential for range, but very few acres are used for this purpose. The climax plant community is tall grasses and an overstory of a few large live oak, elm, and hackberry trees along the drainageways.

This soil has low potential for most urban uses. Its most restrictive limitations are shrinking and swelling with changes in moisture, corrosivity to uncoated steel, low strength, and slow percolation.

The potential for recreation is low. The clayey surface layer and the very slow permeability are the most restrictive limitations for this use. Potential for both openland and rangeland wildlife habitat is medium. Capability subclass IIe; Blackland range site.

**FOR
SALE**

239.52 Acres MOL – Pasture and Recreational Land Marlin, Falls County, TX 76661

Soil Type – 44

44—Ovan silty clay, frequently flooded. This deep, moderately well drained, nearly level soil is on flood plains of major streams. It is flooded two or three times each year; flooding lasts for several hours to several days. Areas are long narrow bands paralleling the stream channel. They have plane slopes of 0 to 1 percent. Individual areas range from 50 to 900 acres in size.

This soil has a surface layer of dark grayish brown, moderately alkaline silty clay about 46 inches thick. The underlying layer, to a depth of 80 inches, is grayish brown, moderately alkaline silty clay.

Permeability is very slow, and the available water capacity is high. The root zone is deep and easily penetrated by roots. Runoff is slow, and the hazard of water erosion is slight.

Included with this soil in mapping are a few areas of Ovan soils that are not flooded annually and intermingled areas of Trinity soils. The included soils make up less than 20 percent of this map unit.

This soil has low potential for production of crops, recreation, and urban uses. Its potential is limited by flooding, which can only be overcome by major flood control.

This soil has high potential for pasture. It is well suited to improved bermudagrass, common bermudagrass, johnsongrass, and kleingrass. Proper pasture management includes fertilization, controlled grazing, and weed control.

This soil has high potential for range. The climax plant community is a mixture of tall and mid grasses and an overstory of oak, elm, hackberry, cottonwood, and black willow trees along the streams.

This soil has low potential for both openland and rangeland wildlife habitat. Capability subclass Vw; Clayey Bottomland range site.

cody@texasfarmandranchrealty.com www.texasfarmandranchrealty.com

**FOR
SALE**

239.52 Acres MOL – Pasture and Recreational Land Marlin, Falls County, TX 76661

Soil Type – 47

47—Satin clay loam, 1 to 5 percent slopes. This deep, well drained, gently sloping soil is on upland ridges and upper parts of side slopes. Slopes are convex. Areas range from 15 to 145 acres in size.

This soil has a surface layer of black, mildly alkaline clay loam about 5 inches thick. Between depths of 5 and 11 inches is black, moderately alkaline very gravelly clay;

and between depths of 11 and 18 inches is brown, moderately alkaline very gravelly clay. Between the depths of 18 and 34 inches is brown, moderately alkaline very gravelly clay that has brown mottles. The underlying material, to a depth of 80 inches, is light yellowish brown and light gray, moderately alkaline clayey marl.

Surface crusts, plowpans, and very gravelly lower layers make this soil difficult to work. Permeability is slow, and the available water capacity is medium. The root zone is deep, but root penetration is slow and difficult in the underlying layers. Runoff is medium. This soil has a moderate hazard of water erosion on the steeper slopes.

Included with this soil in mapping are a few intermingled areas of Burleson and Wilson soils. The included soils make up about 10 to 20 percent of this map unit.

This soil has low potential for production of crops. It is limited for this use by low available water capacity and gravelly layers. The major crops are grain sorghum, cotton, and corn. Improving fertility and improving soil tilth are the objectives of management. Growing small grain or other close-spaced crops help to maintain the soil tilth.

This soil has low potential for pasture. It is well suited to coastal bermudagrass, King Ranch bluestem, and weeping lovegrass. Proper pasture management includes fertilization, weed control, and controlled grazing.

This soil has low potential for range. The climax plant community is a mixture of tall and mid grasses and an overstory of live oak, elm, mesquite, and hackberry trees.

This soil has low potential for most urban uses. Its most restrictive limitations are shrinking and swelling with changes in moisture, low strength, corrosivity to uncoated steel, and slow percolation. The potential for recreation is medium. The clay loam surface layer and the slow permeability are the most restrictive limitations for this use. Potential for openland wildlife habitat is low, and potential for rangeland wildlife habitat is medium. Capability subclass IVs; Gravelly Loam range site.

Information About Brokerage Services

Texas law requires all real estate licensees to give the following information about brokerage services to prospective buyers, tenants, sellers and landlords.

TYPES OF REAL ESTATE LICENSE HOLDERS:

- **A BROKER** is responsible for all brokerage activities, including acts performed by sales agents sponsored by the broker.
- **A SALES AGENT** must be sponsored by a broker and works with clients on behalf of the broker.

A BROKER'S MINIMUM DUTIES REQUIRED BY LAW (A client is the person or party that the broker represents):

- Put the interests of the client above all others, including the broker's own interests;
- Inform the client of any material information about the property or transaction received by the broker;
- Answer the client's questions and present any offer to or counter-offer from the client; and
- Treat all parties to a real estate transaction honestly and fairly.

A LICENSE HOLDER CAN REPRESENT A PARTY IN A REAL ESTATE TRANSACTION:

AS AGENT FOR OWNER (SELLER/LANDLORD): The broker becomes the property owner's agent through an agreement with the owner, usually in a written listing to sell or property management agreement. An owner's agent must perform the broker's minimum duties above and must inform the owner of any material information about the property or transaction known by the agent, including information disclosed to the agent or subagent by the buyer or buyer's agent.

FOR BUYER/TENANT: The broker becomes the buyer/tenant's agent by agreeing to represent the buyer, usually through a written representation agreement. A buyer's agent must perform the broker's minimum duties above and must inform the buyer of any material information about the property or transaction known by the agent, including information disclosed to the agent by the seller or seller's agent.

AS AGENT FOR BOTH - INTERMEDIARY: To act as an intermediary between the parties the broker must first obtain the written agreement of each party to the transaction. The written agreement must state who will pay the broker and, in conspicuous bold or underlined print, set forth the broker's obligations as an intermediary. A broker who acts as an intermediary:

- Must treat all parties to the transaction impartially and fairly;
- May, with the parties' written consent, appoint a different license holder associated with the broker to each party (owner and buyer) to communicate with, provide opinions and advice to, and carry out the instructions of each party to the transaction.
- Must not, unless specifically authorized in writing to do so by the party, disclose:
 - o that the owner will accept a price less than the written asking price;
 - o that the buyer/tenant will pay a price greater than the price submitted in a written offer; and
 - o any confidential information or any other information that a party specifically instructs the broker in writing not to disclose, unless required to do so by law.

AS SUBAGENT: A license holder acts as a subagent when aiding a buyer in a transaction without an agreement to represent the buyer. A subagent can assist the buyer but does not represent the buyer and must place the interests of the owner first.

TO AVOID DISPUTES, ALL AGREEMENTS BETWEEN YOU AND A BROKER SHOULD BE IN WRITING AND CLEARLY ESTABLISH:

- The broker's duties and responsibilities to you, and your obligations under the representation agreement.
- Who will pay the broker for services provided to you, when payment will be made and how the payment will be calculated.

LICENSE HOLDER CONTACT INFORMATION: This notice is being provided for information purposes. It does not create an obligation for you to use the broker's services. Please acknowledge receipt of this notice below and retain a copy for your records. Buyers who are represented by an agent/broker must have their agent/broker actively involved and present at all showings to participate in any co-broker commissions.
