

My name is Wesley Mullins, I have been working for Georgia Plantation Solutions for almost 10 years, and we specialize in managing sport fishery ponds that provide our clients with the best opportunity to catch a fish of a lifetime. [OWNERS NAME REMOVED] has what we consider to be a unicorn pond, that is extremely rare to find. What I mean by that is, when we first started working on this pond, we knew right away this lake was special. On our first visit we electroshocked up a 9lb 8oz bass, multiple 7lbbers and wide variety of fishing ranging from 1-6lbs in size. All of the largemouth bass were extremely healthy, and thriving. More importantly the forage base was already very well established, and only lacked shad. The pond had bluegill, redear, and shiners before we ever started working on the pond. Following this first electroshocking visit we began stocking threadfin shad to further supplement the pond, and more bluegill to boost their population. We implemented a culling program to remove all largemouth bass 15" or less to promote larger fish, and suggested to remove any other predators such as bowfin or Pickeral(jackfish). Every year since starting this pond we have electroshocked the pond to track progress, and restocked forage to continue our progress. Every spring we have shocked up at least one bass over 7lbs, and have seen multiple 9+ and unfortunately missed a few opportunities at a few 10+lb fish. Thankfully this year we finally broke the curse, and netted a 11lb 12oz largemouth bass. Us as a company have never seen a 10lb bass captured by our electroshock boat, and previously [OWNERS NAME REMOVED] pond held the record at 9lbs 8oz. The 11lb bass had another 10+ lb bass with her, but she unfortunately escaped our net attempts. I say all of this to describe that is pond is by far the best pond I have ever had the chance to work on. We manage thousands of ponds throughout Georgia and South Carolina, and none of them come close to this pond in Fairfax.
